ABOUT VIS

VIS is a product of COEL Italy.

Since 1976 COEL designs and manufactures brake motors and electromagnetic brakes producing all the components including the brake units in its facilities (see www.coel-is.com).

Thanks to this large experience, in 2005 we invented VIS, the modular brake system for hazardous location.

Our idea was based on the market demand of an easy solution in order to obtain a brake motor without modification of the motors or extension of the certificates.

More than 35 checks made in the production process make of each VIS brake a top quality braking unit.

The VIS brakes range is in continuous development in order to make its quality and performance better and better.

Our range includes today various versions with braking torques between 3 to 16.000 Nm, suitable for any application.

For hoisting, travelling, positioning in hazardous location, the VIS brakes are the safe and reliable solution.

WHAT'S VIS

The VIS brake is an innovative modular flameproof spring applied disc brake unit.

The new concept is to apply an independent brake unit to a standard flanged explosion proof motor or to a transmission unit. The flanges input and output follow both IEC or NEMA standards.

Besides the face to face lines (IEC and NEMA), also available is the COMPACT LINE version, suitable to be applied to the NDE of an electric motor or to any transmission unit.

The VIS brakes are certified as independent components. It means that there are not coupling procedures in order to define the certification.

WHY VIS?

The VIS brake is available in IEC flange face to face version (B5 63 to 315), NEMA standards (56 to 405) and COMPACT LINE for the mounting in the rear part of an electric motor or to a transmission unit.

The assembling is very fast.

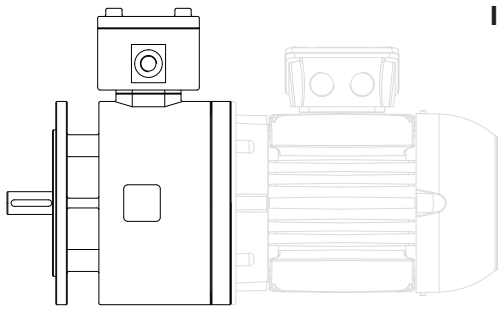

Choosing the VIS brake, it's very easy to make an explosion proof brake motor, reducing costs and delivery time.

The performance of VIS brakes is particularly high and the strong structure makes them suitable for very heavy duty and for every kind of application (hoisting, travelling, positioning...).

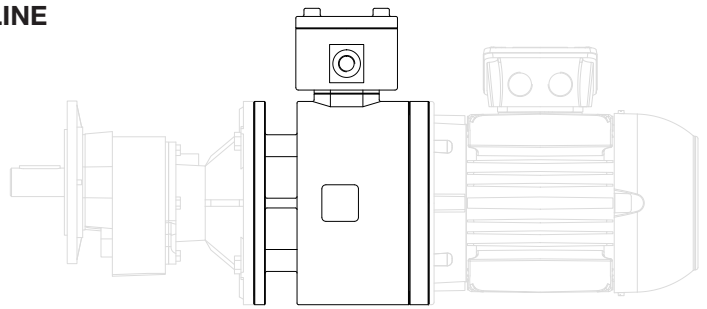

The braking torque values are included between 3 to 16.000 Nm* and the electromagnets fitted inside the VIS brakes can be AC three phase or DC with built in rectifier*.

*depending on frames and sizes

IEC LINE

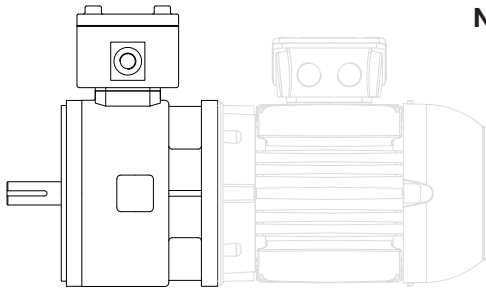

Standard IEC motor + VIS brake

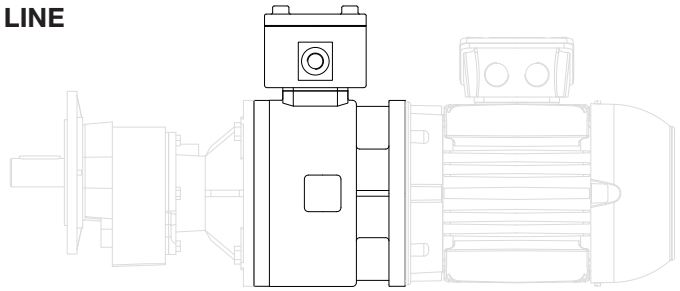

Standard IEC motor + VIS brake + gearbox unit

NEMA LINE

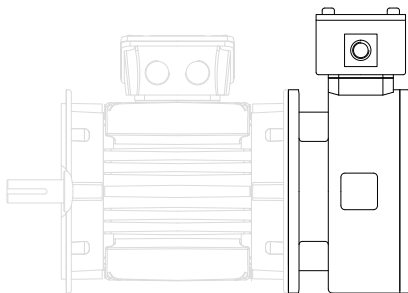

Standard NEMA motor + VIS brake

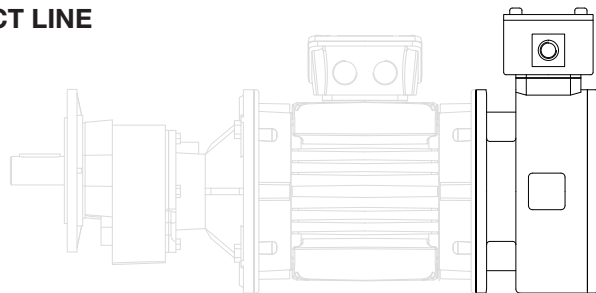

Standard NEMA motor + VIS brake + gearbox unit

COMPACT LINE

Standard motor + VIS brake

Standard motor + VIS brake + gearbox unit

- Patent pending design and concept system
- Three phase AC or single phase DC electromagnets*
- Totally closed
- IP66
- Power supply VAC24 to 690 50-60Hz three phase or VDC 24 to 300 with built in rectifier*
- F class insulation
- Thermally protected with bimetal protectors as standard
- Large terminal box with terminal board
- Very high resistance structure
- Designed for S1 duty without ventilation*
- Cast iron construction (Steel frame for IEC 315 type)

*depending on frames and sizes

NAME PLATES

Nameplates are made in stainless steel and secured on the brakes body

General information

The spring-applied brake VIS is a single or multi disk brake system with two friction surfaces for each disc mounted.

The compression springs create the braking torque by friction.

The brake is electrically released.

The spring-applied brake is designed for the conversion of mechanical work and kinetic energy in heating. For operation characteristics ask to us about the admissible work and the duty cycle.

Manual Release

The manual release is an available option, it gives the possibility to release the brake in absence of current.

Monitoring Switch

The VIS brakes can be equipped with a switch (electro mechanical or inductive) for monitoring the operation of the mobile anchor inside the brake and the consequent open or closed status of it. The user must provide the corresponding electrical connection.

Thermistors

All the VIS brakes are equipped with a PTO thermal protection with temperature limit related to the temperature class of the brake required. It must always be connected when operating in order to prevent extra heating in hazardous areas.

The application of a PTC thermistor is also available in order to get a constant monitoring of the brake temperature through an external PLC.

The size of the brake is mainly determined by the braking torque and the relevant inertia of the load, braking time, speed, number of starts per hour.

For further detailed calculation regarding your application please contact us.

Before ordering a VIS Brakes fulfill the checklist as shown in page 19 of this catalogue.

Brake Torque And Braking Time

It is possible to define the braking time of the motion using the following formula

$$\frac{J_{tot} \times n}{9.55 (M_f \pm M_{load})} + \frac{t_x}{1000}$$

J_{tot}: inertia moment at the motor shaft (Ggm²)
 t_x: brake time response (ms)
 M_{load}: resistent moment to the load applied (Nm), positive or negative depending on concordance with brakung moment.

Note: for calculation of sliding time of the disc, consider the "tx" value at "0". M_f: braking moment (Nm) n: speed r.p.m.

compact line only

VOLTAGES

The VIS brakes are available in many voltages. The following chart indicates the available range.

RECTIFIERS

All the VIS brakes with DC magnet are supplied with built in rectifier fitted into the terminal box.

The standard rectifier is half wave for voltages between VDC 50 to 300 and full wave for lower voltages.

The standard half wave rectifier (WR type) provides both pick in engagement and fast action in braking; it means that there is no need of external connections (DC side cutting) to be done in order to get the fast action of the brakes.

Full wave rectifiers (4440 type) are equipped with an additional wire for DC cutting in order to obtain the fast action of the brake.

IEC and NEMA line

IEC and NEMA VIS brakes line is designed to be mounted in front of a flanged motor; the bearing used in the input shaft has the only function to support the coupling between the motor and brake shafts and cannot be subjected to additional axial or radial loads.

COMPACT line brakes are designed without output traction shaft.

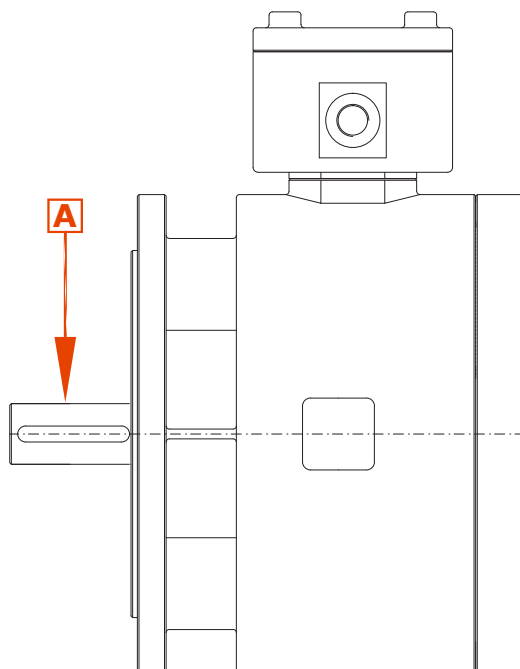

The output shaft admissible radial loads of IEC and NEMA and input shaft COMPACT LINE allowed radial loads are described in the following tab.
